How endpoints are invoked

Json API Request **ANYPLACE** calls **ROUTING:** - conf/routes: Once new web app is developed. this file wont be necessary - conf/api.routes: **Controllers:** IDatasource.scala (trait) Contains all datasource **Grouped:** per functionality. methods calls Called by: the routes. Calls: methods from PDB, or other inherits inherits custom implementation (i.e., filesystem for radiomap raw files) MongodbDatasource.scala: **ProxyDataSource.scala:** (MDB) (PDB) Provides an implementation through MongoDB Queries. For each method, it connects to the relevant database and then calls the relevant implementation. Its purpose is to provide an abstraction to the

underlying DB.
